Executive Summary

This proposal outlines our plan to implement a structured digital transformation.

AI-Powered Job Market Insights is an advanced analytics project designed to harness AI's impact on global employment through integrated data tools. Utilizing a dataset of 30,000 job records, this initiative combines SQL querying, Python scripting, Tableau visualizations, and Excel management to deliver actionable insights on automation risks, salary trends, and workforce shifts. By fostering data-driven decision-making and innovative reporting, the project aims to provide comprehensive AI job market intelligence, enhancing decision-making and promoting adaptive career strategies in an evolving landscape.

Problem Statement

Rapid AI advancements create challenges in analyzing the job market.

Key issues include:

- Data is scattered and not well connected.
- Metrics on automation, performance, and trends are unclear.
- Hard to combine insights from different sources.
- Difficult to share AI insights in a clear way.

Project Objectives

Primary Goals

Data Analysis

Analyze job data to find AI trends

Dashboard Integration

Build interactive dashboards for insights

Insights Sharing

Share AI trends online clearly

Client Value

Provide actionable insights to clients

Success Factors

Clear adoption, stable performance, and consistent use across teams.

Project Workflow

1. Data Collection and Cleaning:

Gather datasets and clean them using SQL and Excel to ensure accuracy.

2. Data Modeling and Dashboarding

Analyze and visualize data using Python, Tableau, and Power BI

3. Execution and Testing

Validate insights, test dashboards, and ensure accuracy

4. Final Deployment and Presentation

Deliver dashboards, reports, and visual insights to stakeholders

Tools

SQL

Python

Excel

Tableau

Power-BI

Key Performance Indicators (KPIs)

KPIs

Change in automation risk assessments pre- and post-analysis.

Dashboard usage across departments during pilot.

Reach of over 5,000 users per insights campaign.

80% client satisfaction with visual and dashboard presentations.

Proposed Approach

Phase 1

Planning Stage

Collect job market datasets from reliable sources covering roles, salaries, automation risk, and industry trends

Phase 2

Cleaning & Preparation

Use SQL and Excel to clean, normalize, and structure the data for analysis

Phase 3

Visualization & Reporting

Create interactive dashboards and clear reports to communicate findings effectively.

Phase 4

Validation & Review

Continuously verify accuracy of data, insights, and visualizations before final delivery.

Project Timeline

Phase	Duration
Planning stage	1 weeks
SQL	2 weeks
Python	2 weeks
Tableau	2 weeks
Power BI	2 weeks
Validation & Review	2 weeks

The timeline may be adjusted after initial discovery.

Roles

Reham Ayman

SQL
Dashboard Tableau
Documentation

Sogoud

Dashboard Excel
Dashboard Tableau

Moataz

Preprocessing the
dataset
Python

Elsayed

Modeling Dataset
Power BI

Youssef

Modeling Tableau

Sara

Modeling Dataset

Expected Outcomes

A clean AI job dataset integrated with visualization tools.

Execution of insights campaigns with live metrics on AI trends.

Establishment of brand identity guidelines and documentation templates.

Delivery of actionable AI insights with measurable impact.

The End

THANK YOU FOR LISTENING
